Joint Technical Talk:

Mega Earthquakes – Impacts, Cause and Predictions

Jointly organized by HKIE EVD, CVD, AMC, YMC, the China Universities (HK) Alumni – Engineers Division, and Engineers Australia Hong Kong Chapter

Due to the overwhelming response to the seminar on Mega Earthquakes on 24 May 2012, the same seminar will be conducted again on Friday 31 August 2012.

Date, Time & Venue

31 August 2012 (Friday): 6:30pm to 8:00pm; reception starts at 6:00pm at Hong Kong Productivity Council (HKPC), at **78 Tat Chee Avenue, Kowloon Tong.**

Programme Highlights

In the last ten years, many mega-earthquakes occurred and caused many casualties to human beings and devastating disasters to environments. In this seminar, Dr. Yue will give a brief review on the impacts of the mega-earthquakes happened in China and around the Pacific Ocean in recent years. He will then discuss the cause of earthquakes. He will use facts to show that the earthquake energy is the volumetric expansion energy of highly compressed and dense natural (methane) gas escaped from deep crust traps along deep fault zones. Based on this energy hypothesis, Dr. Yue will explain the reasons why many seismologists believe the next damaging earthquake unpredictable. He will further put forward a new approach for effective and accurate prediction of the next damaging earthquakes.

Speaker

Ir. Dr. Quentin ZQ Yue, Department of Civil Engineering, The University of Hong Kong.

Registration & Enquiries

Please register online.
